

Php5 en mod (php7-also)

After installing php modules, some are not enabled by default upon installation.

One of those modules is php5-imap and php5-mcrypt is another one.

You have to enable them with php5enmod command.

php5enmod works just like the way a2enmod works for Apache.

[crayon-662f0ae82d4a3971543047/]

... php5dismod, just like a2dismod works.

- enabled php modules with...

[crayon-662f0ae82d4aa944661193/]

“php -m” list,
